## **DETAILED ACTION**

### ***Response to Election***

Applicant provisionally elected the species II without traverse. Applicant also designated that the claims 1-3, 7 and 11 read on species II. Examiner disagrees with this statement. Claims 1 and 2 read on species II. However, claim 3 reads on species III because the recitation "function of detecting an average voltage" only describes the Fig. 5 and claim 7 also reads on species III because the recitation "function of using the bipolar transistor to detect an average output current " only describes the Fig. 5 and claim 11 also reads on species III because the recitation "function of detecting an average value of base current or collector current" only describes the Fig. 5. Therefore, it is concluded that the claims 3, 7 and 11 are considered non-elected claims.

### ***Claim Rejections - 35 USC § 102***

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.

Claims 1 and 2 are rejected under 35 U.S.C. 102(e) as being anticipated by Apel (Fig. 3).

Regarding claim 1, Apel (Fig. 3) discloses an amplifier circuit comprising a bipolar transistor (102) for emitter ground (emitter of 102 is grounded) amplification having a base (base of 102) connected to an input terminal (112) and a base bias power supply (122) and having a collector (collector of 102) connected to an output terminal (a node between the collector of 102 and load 106).

Art Unit: 2817

Regarding claim 2, a resistor (108) and a coil (114) are inserted parallel between the base (base of 102) and the base bias power supply (122).

***Conclusion***

The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

Patent numbers (6,750,721; 6,822,517) are the amplifiers with the bias networks.
